

Impact and Benefits

Samadhan (समाधान)

This note separates **what we measured**, **what the design guarantees**, and **what we cannot claim yet**.

1. Measured

Measure	Result	How measured	Caveat
Department routing accuracy	About 90% exact on 60 messages: hand-written 25 of 26, synthetic Bundeli/Malvi 29 to 30 of 34	<code>backend/tests/prompt/run_routing_eval.py</code> , results in <code>submission/routing-eval-results-*.json</code>	Measured on our earlier LLM-based routing, before Jev was added. One run per data set. Synthetic data was written by an LLM and not checked by native speakers. Remaining misses are mostly debatable labels
Water-issue extraction	12 to 13 of 15 on the two best of six runs (11, 10, 9, 9, 13, 12)	<code>submission/T13-prompt-test-results-run*.json</code>	The 13/15 target was met once, not consistently
Automated tests	415 backend + 35 dashboard tests pass; Ruff clean	<code>uv run pytest</code>	Tests use no network or keys; they check logic, not live accuracy
Definition-of-done scenarios	All ten exercised end to end with real providers; scenario 7 (GPS to the correct ward) cannot pass yet	Scripted run	Ward centre points are not available, so a GPS-only complaint goes to the district office

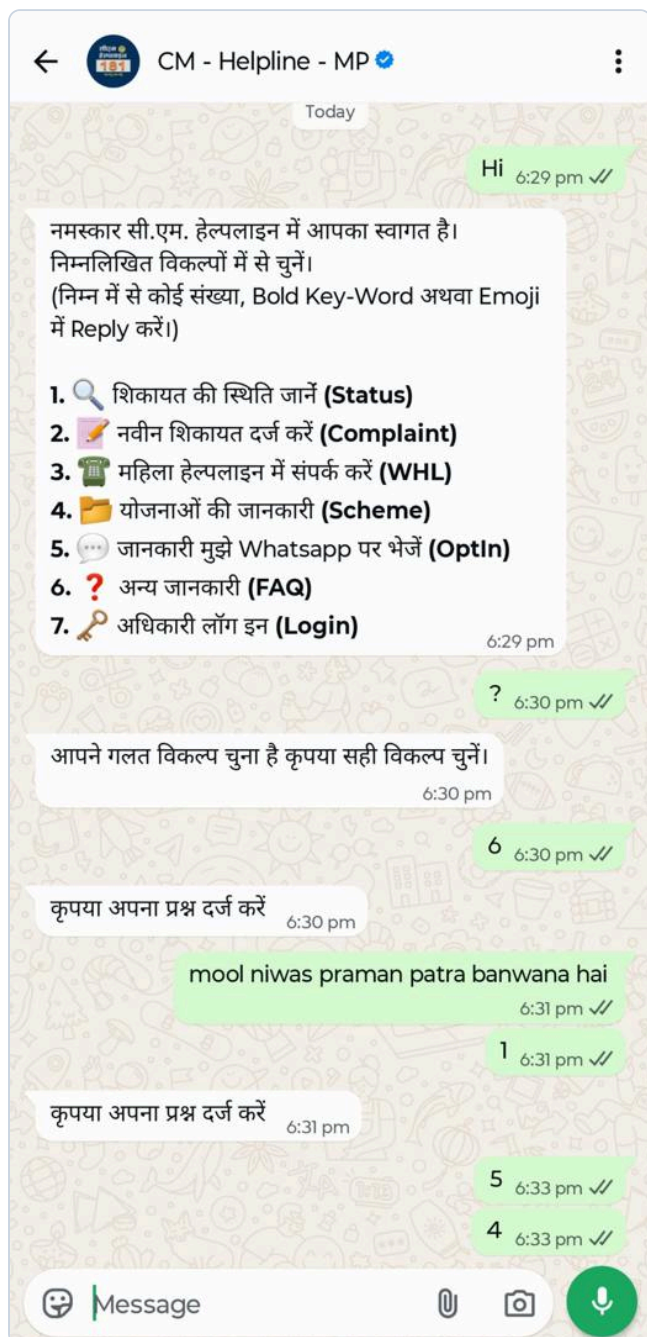

2. Guaranteed by design (verifiable in the code and specs)

- **Fewer steps to file.** A citizen who gives everything in one message goes straight to confirmation. The minimum path is **describe** → **confirm** → **ticket**, two citizen messages (scenario 3 in `docs/PROJECT.md`). Missing details are asked one at a time.
- **No department knowledge needed.** The citizen never chooses a department or a form.
- **No typing needed.** Voice in, voice out.
- **No silent misrouting.** Low confidence goes to the district office as `needs_review`, and every officer correction is logged.
- **No duplicate tickets from retries.** A repeated message ID returns the stored answer.
- **Feedback for the citizen.** A complaint number, and status by typing or saying it.
- **Less triage work for officers.** Tickets arrive with a department, office, summary, audio and a review queue.

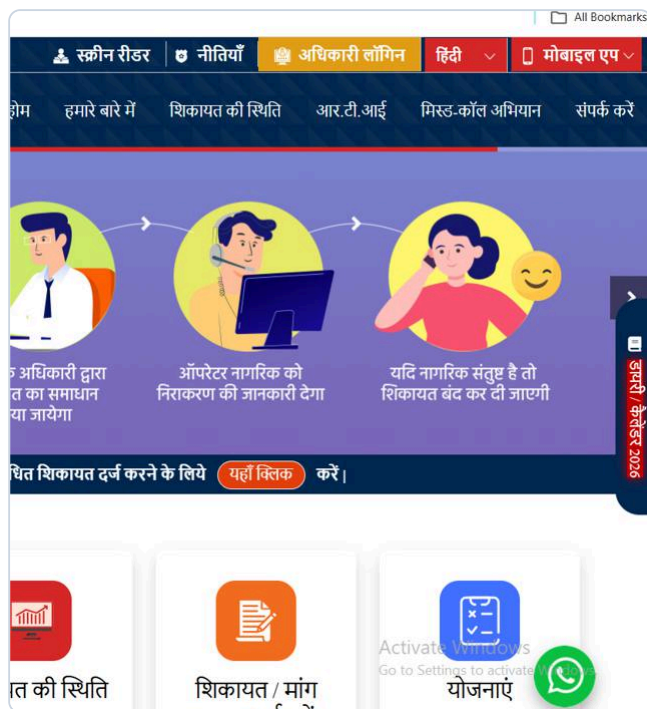

3. What we saw in an existing channel (CM Helpline on WhatsApp)

We tried the CM Helpline WhatsApp bot on 1 October 2026. It opens with a numbered menu of seven options: status, new complaint, women's helpline, schemes, opt-in, FAQ and officer login.

- The citizen has to pick a number. When we sent a "?", it replied that we had chosen a wrong option and asked us to choose again.
- After choosing the FAQ option, the bot asks the citizen to type the question. We typed a Hinglish question (*mool niwas praman patra banwana hai*). No answer came back in the chat, and the bot asked for the question again.
- There is no voice input, and the citizen must already know which of the seven menu options fits.

The CM Helpline WhatsApp bot: a numbered menu

The CM Helpline website, with its WhatsApp button

	CM Helpline WhatsApp bot (our one test)	Samadhan
How the citizen starts	Pick a number from a menu of 7	Describe the problem in their own words
Voice input	Not seen	Yes: press and hold, in Hindi or Hinglish

	CM Helpline WhatsApp bot (our one test)	Samadhan
A free-text Hinglish question	No answer in our test	Understood and routed to a department
Must know the department	Must pick the right menu option	No

This is one short test by our team, not a full evaluation, and we make no claim about the platform's overall performance. We did not count taps or typing time, so we do not give those numbers.

4. What we do not claim

- Any reduction in **resolution time**. That needs real usage over time, not a hackathon pilot.
- Statewide numbers, citizen counts, cost savings or call-centre load reduction. None have been measured.
- Dialect coverage beyond Hindi and Hinglish that a native speaker has confirmed.

5. Expected benefits at pilot scale (hypotheses to test, not results)

1. Fewer wrongly routed complaints, measured by the count of officer reassignments in `routing_corrections`.
2. Faster first response, measured by time from filing to first status change.
3. Less officer triage time, measured by time spent on the review queue.
4. Higher filing rate from citizens who avoid forms, measured by complaints filed by voice.

6. Future plan and added benefits (our roadmap, not results)

Samadhan solves the main problem today: a citizen speaks, and the complaint reaches the right department. The plan below shows what it adds next, and the benefit each step brings. These are goals, not measured results.

Stage	What we add	Added benefit
Next	Verified office and ward data, a real SMS OTP once the SMS licence is obtained, rate limits	Trusted complaints, fewer false or fake ones, and the right ward every time
Then	WhatsApp and phone calls on the same engine	Reaches citizens without a smartphone or internet. A call is as easy as speaking in a village
Dialect data	With clear consent and rules, keep the voice, the words, the department and officer corrections as organised data	The real dialect conversation data that Madhya Pradesh lacks today. The government, as the legal authority, would hold it only to improve public services
Future models	Use that data to help train language models that talk to citizens like a real person	Government services that understand every dialect, in every district
Later	More departments and districts, per-department officer accounts, hand-off to MPOnline channels	Statewide scale, and officers who see only their own department's tickets

A stronger Madhya Pradesh. A citizen who is heard trusts the system, a trusted system attracts business, and business builds the future of the state. This is our hope, and we have not measured it.

Calls and recordings will be kept only with clear consent and a retention policy, which we will put in place before any public launch.
